                                                   Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Osteoprotegerin

Human osteoprotegerin binding protein from the pcDNA/huOPGbpl.linsert.

Human; osteoprotegerin binding protein; OPG binding protein; arthritis; osteoporosis; osteoclast maturation; bone disease; metastasis; ODAR; hypercalcaemia; osteoclast differentiation and activation receptor; Paget's disease; 88.

```
CC Host cells transfected with vectors containing nucleic acid molecules
CC encoding OPG binding protein are used to produce recombinant OPG binding
CC protein. OPG binding protein is used in binding assays to determine
CC osteoprotegrin (OG) in biological samples; to screen for specific
CC binding agents (particularly agonists and antagonists, including
CC intracellular proteins); to raise Ab (useful in immunoassays for
CC detection of OPG binding protein) and to identify compounds that
CC modulate binding of OPG binding protein to osteoclast differentiation
CC and activation receptor (ODAR). The nucleic acid molecule encoding OPG
CC binding protein can be used to detect OPG binding protein-encoding
CC sequences, e.g. screening for related sequences, also to produce
CC transgenic animal models, while complementary sequences are used for
CC antisense regulation of OPG binding protein expression. Modulators of
CC OPG binding protein, particularly soluble forms of OPG binding protein
CC or Ab, are used to treat or prevent bone diseases, e.g. osteoporosis,
CC bone loss caused by arthritis or metastases, hypercalcaemia, Paget's
CC disease, periodontal disease, osteoporosis, lossening of prostheses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-MAR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes an osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcitriol or parathyroid hormone (PTH). OBM is isolated from stroma cells cultured in the presence of bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (sOBM) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological activity, and screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic purposes, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

```
The present sequence encodes an osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM). The protein promotes and supports the Separation and maturation of osteoclasts in the presence of bone 2C absorption factors such as calcitriol or parathyroid hormone (PTH). COBM is isolated from stroma cells cultured in the presence of a bone 2C absorption factor by separation and solubilisation of membrane proteins 2C then affinity chromatography using OCIF. It exists in a full-sequence 2C form and a solubilised form (sOBM) which is a shorter chain. OBM may be 2C used for screening potential inhibitors and modifiers of its biological 2C These substances can then be used in the treatment of disorders of bone 2C used for calcium metabolism. The antibodies can be used for assay 2C of the protein, for investigative and diagnostic purposes, and as 2v vv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 199

                                The present sequence encodes human TNF-related activation induced cytokines (TRANCE). Human or murine TRANCE polypeptides or their variants, fragments, derivatives or analogues may be used as modulators of immune response in a mammal comprising, antisense sequences to TRANCE and fusion proteins comprising human and/or murine TRANCE. Agonists and antagonists of TRANCE, can be used to modulate immune response by increasing or decreasing the life span of mature dendritic cells and increasing or decreasing T cell activation. These techniques are especially useful for treating immune system related conditions such as HIV, cancer, autoimmune disease or hypersensitivity to an allergen. The TRANCE polypeptides can be used to increase the viability of dendritic cells in vivo or in vitro, especially when used in conjunction with proteins of the tumour necrosis factor (TNF) superfamily (especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Key

ODF is thought to be directly involved in the differentiation of monocyces/macrophages into osteoclasts. Osteoclasts promote dissolution of the bone matrix and solubilisation of bone salts. The present sequence is useful in gene therapy, and as hybridisation probes or primers. ODF protein is useful for modulating the activity of cells, e.g., cell proliferation, cell differentiation and cell viability, as immunogens to generate anti-rat ODF antibodies, and as vaccines. Anti-rat ODF antibodies are useful in assay methods for quantifying ODF polypeptides.

OBM is isolated from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCTF. It exists in a full-sequence form and a solubilised form (soBM) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological activity, and screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic purposes, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        an osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                               The present invention describes a genomic DNA encoding a protein having an activity of supporting or promoting differentiation and maturation of consteoclasts. The genomic DNA encoding a protein has the following properties: (a) combines specifically with osteoclastogenesis inhibitory factor (OCIF) and has a high affinity; (b) shows a molecular weight (mw) of 30,000 to 40,000 by SDS-PAGE (sodium dodecyl sulfate-polyacrylamide yel electrophoresis) under a nonreductive condition and the apparent mw when crosslinked with monomer type OCIF is 90,000 to 110,000; and (c) has an activity of supporting or promoting differentiation and maturation of osteoclast in the co-culture of mouse osteoblast-like stroma cell and consuse spleen cell in the presence of a bone absorption promoting factor such as active type vitamin D3 and parathyroid hormone (PTH). The protein can be used as a drug and a research reagent. The present sequence encodes a mouse OCIF binding molecule (OBM) from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SNOW)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  JP2000102390-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; osteoclastogenesis inhibitory factor OBM; osteoclast; bone absorption promoting parathyroid hormone; ds.

Osteoprotegerin is a secreted member of the tumour necrosis factor, receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclast. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Osteoprotegerin ligand; OPGL; osteoprotegerin; osteoclastogenesis; tumour necrosis factor receptor; type II transmembrane protein; osteoclast differentiation; CSF-1; osteoclast activator;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes the osteoclast formation promoting factor (OBM). The invention relates to an OBM binding protein (OBM-BP). The protein is useful as a preventive and/or treating agent for bone metabolic diseases such as osteoporosis. Substances which inhibit the binding of OBM to OBM-BP can be used as biochemical reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 951

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is human osteoprotegerin (OPG) binding protein.
CC Host cells transfected with vectors containing nucleic acid molecules canceding OPG binding protein are used to produce recombinant OPG binding protein are used in binding assays to determine osteoprotegrin (OPG) in biological samples; to screen for specific binding agents (particularly agonists and antagonists, including contracellular proteins); to raise Ab (useful in immunoassays for modulate binding of OPG binding protein) and to identify compounds that modulate binding of OPG binding protein to osteoclast differentiation and activation receptor (ODAR). The nucleic acid molecule encoding OPG binding protein can be used to detect OPG binding protein-encoding CC sequences, e.g. screening for related sequences, also to produce transgenic animal models, while complementary sequences are used for antisense regulation of OPG binding protein expression. Modulators of OPG binding protein, particularly soluble forms of OPG binding protein, paget's of options of OPG binding of prostheses, periodontal disease, osteoporosis, hope creates and paget's options of OPG binding of prostheses, options of OPG binding protein of OPG binding protein of OPG binding protein options of OPG binding protein of OPG binding options of OPG binding of OPG binding of OPG binding options of OPG binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC activator of necrosis factor kappab (NF-kB)) polypeptide. RANK is a CC member of the tumour necrosis factor (TNF) family. A soluble RANK CC may be used for inhibiting activation of NF-kB, by contacting a cell C expressing membrane-associated RANK with a soluble RANK which binds to CC RANK ligand (RANKL). RANKL polypeptides can activate RANK which binds to CC allo-stimulatory capacity, thereby augmenting an immune response. The CC allo-stimulatory capacity, thereby augmenting an immune response. The CC immune or inflammatory response. Inhibition of NF-kB by RANK antagonists CC may be useful in ameliorating negative effects of an inflammatory CC response that result from triggering of RANK, e.g. in treating toxic CC shock or sepsis, graft-versus-host reactions, or acute inflammatory CC reactions. They can also be used in adjunct therapy for disease CC can also be used to identify inhibitors of RANK. RANKL polypeptides CC can also be used for protecting RANK. RANKL polypeptides CC can also be used for protecting RANK. Pospressing cells from the negative effects of chemotherapy or the presence of high levels CC from the negative effects can also be used for protecting RANK-expressing cells cof TNF-alpha. The products can also be used for detection and drug

                                                                                                                                                                                                             activator of necrosis factor kappaB (NF-kB)) polypeptide. FANK is a member of the tumour necrosis factor (TNF) family. Host cells transformed or transfected with an expression vector comprising the RANK encoding nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to RANK ligand (RANKL). The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for disease characterised by neoplastic cells that express RANK. The products can also be used for detection and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-OCT-1997;

The present sequence represents a human osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Osteoprotegerin ligand; OPGL; osteoprotegerin; osteoclastogenesis; tumour necrosis factor receptor; type II transmembrane protein; osteoclast differentiation; CSF-1; osteoclast activator;

OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption.

regulating immune re adjunct therapy for express RANK .-New receptor activator of NF-kappaB (RANK) polypeptides, useful for regulating immune response, in screening for RANK inhibitors, or as adjunct therapy for disease characterized by neoplastic cells that or as an

Example 15; Column 71-72; 47pp; English.

cc are useful for regulating immune response and in screening for inhibitors of signal transduction, e.g. for screening for inhibitors of signal transduction, e.g. for screening the common of real properties and particularly TRAF6. NF-kappaB inhibition by RANK antagonists of are useful in ameliorating the negative effects of an inflammatory cc response that result from triggering of RANK, e.g. in treating twoic cc shock or sepsis, graft-versus-host reactions, acute inflammatory cc reactions and the effects of bone resorption. RANK acts as an antice appropriate signal and rescue the cells that express RANK from apoptosis. Cc Soluble forms of the receptor are used in vivo or in vitro based cc antagonists of RANK-mediated NF-kappa B activation, or to inhibit transduction of a signal via RANK. RANK compositions are used in the adjunct therapy for disease characterised by neoplastic cells that express RANK. Compounds that interfere with RANK/TRAF6 interactions are useful for modulating osteoclast function and activities. They recursors and for modulating osteoclast function and activities. They care used as inhibitors of diseases associated with excess bone resorption and as immunosuppressants or anti-inflammatory agents. The RANK DNAs are useful for the expression of recombinant proteins, as probes for analysis of are useful in preparing kits for the detection of soluble RANK, or analysis of monitor RANK-related activity. The present sequence is RANK ligand cc ranker, are related activity. The present sequence is RANK ligand kappaB (RANK) proteins and their corresponding DNAs. RANK is a member of the tumour necrosis factor (TNF) receptor superfamily and associates with TNF receptor associated factor (TRAF) 2 and 3 which are important in the regulation of immune and inflammatory response. The receptors receptor activator of nuclear factor (NF)-

                                                                                                                                                                                                                                                     The present invention relates to receptor activator of NF-chi B (RANK) DNA. RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) to chromosome 13q14. RANK and RANKL are type 1 and type 2 transmembrane proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular region. RANK associates with TNF receptor-associated factor (TRAF) 2 and TRAF3. The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening for inhibitors of RANK. The present sequence is human RANKL (hurankkl)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        23-DEC-1996;
